

Stationary air monitoring systems

ST-ARIA

We have developed specific fixed or transportable solutions for measurements. Also used by our military in the various scenarios of operational activity around the world.

The station, **fixed or mobile**, looks like an equipped structure 2-3 meters high, on which various sensors, both meteorological and gas, are mounted, such as: PM2.5 – PM10 dust; VOC, O3, CO, SO2, NO2, NH3 etc.

All connections are with connector for easy installation and management. The data is stored locally and can be sent remotely via modem, cable, radio, etc.

For **simpler systems** it is possible to use an **IoT transmission** and have the measurement directly online and easily create networks with widespread measurement points.
